

Power Transmission Solutions

Standard Gears

The Company

Cross & Morse was established in 1984 through the amalgamation of two long standing and well respected companies in the Power Transmission Industry, T.D.Cross and Morse Chain.

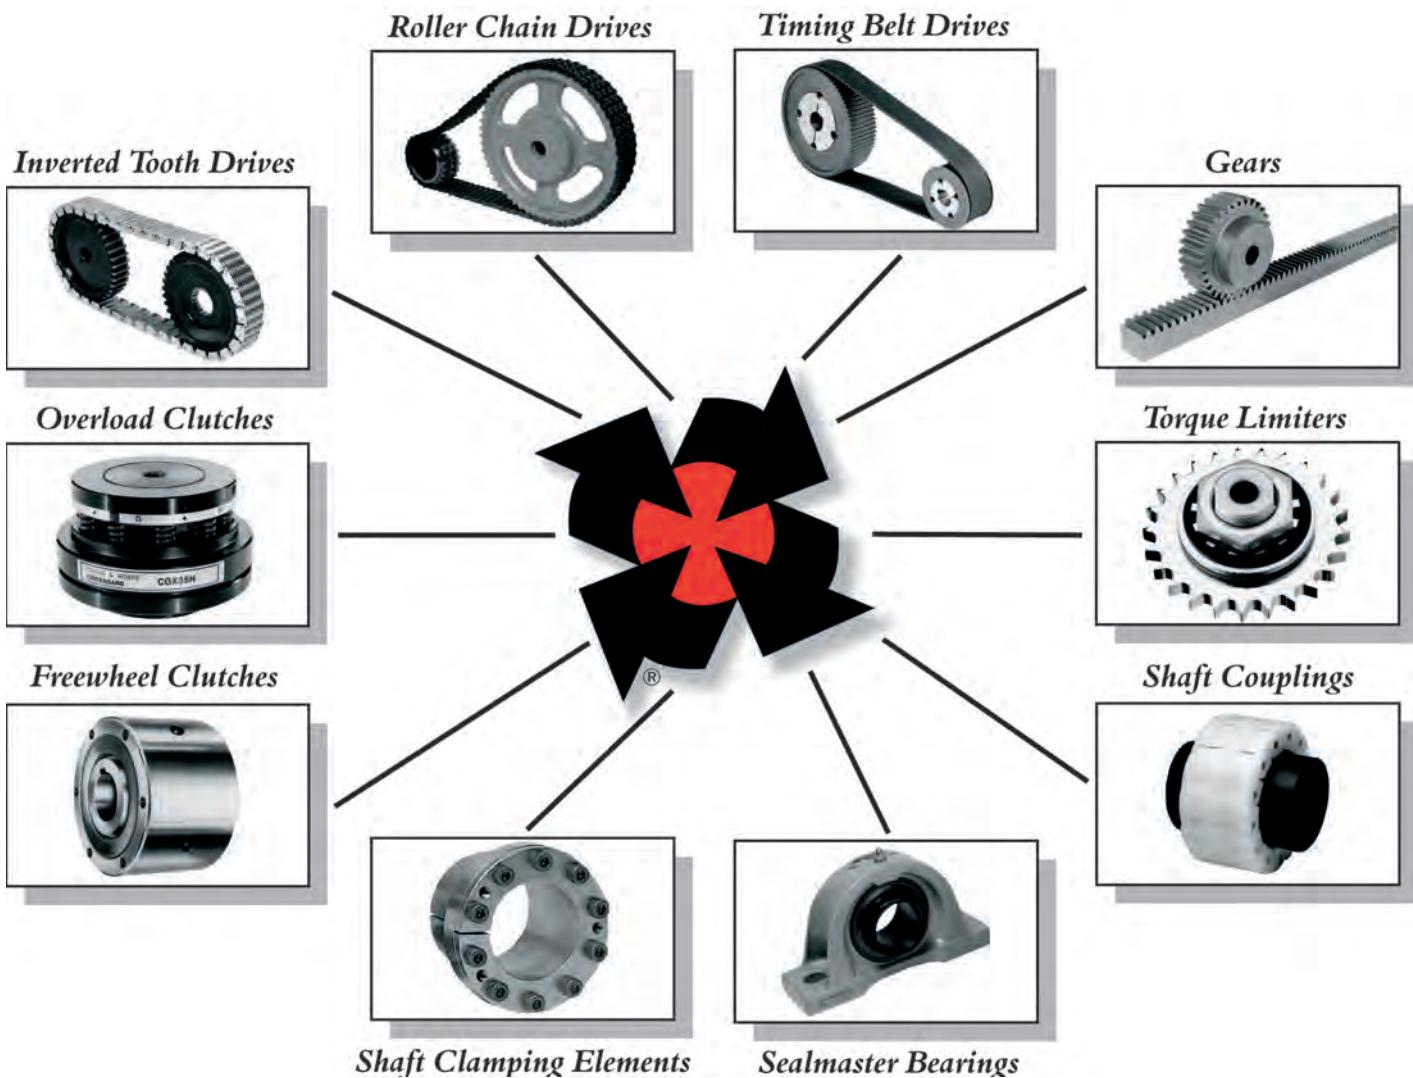

T.D. Cross & Sons was founded in 1870 in Birmingham, concentrating in the production of bicycle components under the direction of the Cross family. They moved to the current factory site in 1950 and developed into production of a popular range of roller chain sprockets and gearing.

The Morse Chain Company was founded in 1894 also for the manufacture of bicycles in Pennsylvania, U.S.A. The company moved into production of inverted tooth chain drives and established a manufacturing plant in London in 1907, moving to the new Garden City of Letchworth, Herts. in 1918. The product range in the U.K. was developed to include Roller Chain and Sprockets, Couplings, Torque Limiters, Sprag Clutches and Timing Belt Drives, whilst in the U.S.A. by acquisition Morse also included the Sealmaster Bearing Products.

In 1987 Cross & Morse closed the Letchworth plant and centralised all production at the 10,000 sq. metre factory in Great Barr, Birmingham where current production of Roller Chains, Sprockets, Gears, Timing Belt Pulleys, Torque Limiters, Sprag Clutches and other specialised power transmission equipment is undertaken. In addition to manufactured products, Cross & Morse are main agents for Regal-Beloit, U.S.A.; providing an extensive range of power transmission products.

The company has in recent years expanded its markets into new areas which include food processing and pharmaceutical industries.

The company operates a policy of continued assessment to develop and improve its products and customer service. In pursuance of these objectives Cross & Morse has been successfully assessed as an approved manufacturer of power transmission products to BS EN ISO 9001.

Gear Products

Cross+Morse offer a comprehensive range of standard stock gears which, coupled with the capability to supply on short lead times custom designed gears, provides the design engineer with a wide spectrum of solutions from which to select open gear drives.

Standard Stock Gears

The range of standard stock gears is detailed in the following catalogue pages, including recommendations for gear selection, can be summarised as follows:

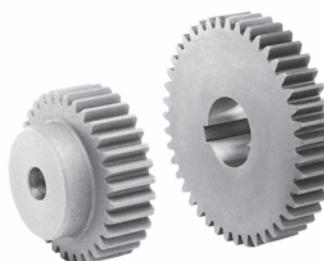

Bevel and Mitre Gears

Straight Cut Bevel and Mitre Gears manufactured to the Gleason system in medium carbon steels enable simple right angle drives with reduction ratios up to 4:1. Two series of gears are offered, the first the original T.D. Cross range to imperial dimensions from 16DP to 5DP pitch, the second a much improved metric range of gears from 1 Mod. to 5 Mod. pitch. All gears can be induction or flame hardened for longer life under arduous conditions.

Spur Gears

A range of 20° P.A. spur gears all manufactured in medium carbon steel, provide selection from 1 Mod. through to 6 Mod. pitch with gears from 12 teeth to 127 teeth. All gears have face width equal to ten times Mod. number to provide sensible power transmission capability.

Straight Racks

Available in standard lengths of 0.5, 1.0, 2.0 and 3.0 metres is a range of 20° P.A. straight cut racks with pitch range 1 Mod. to 8 Mod. These are designed to combine with the standard spur gears to provide low cost conversion of rotary to linear motion.

Special Custom Made Gear Products

Modification of standard gears by reworking the bore and faces, and adding heat treatment often provides the most economical gear solution; but for those applications where standard gears cannot be used, special gears and racks can be manufactured within the following limits.

Mitre and Bevel Gears

Straight cut gears to the Gleason System up to 500mm diameter, can be provided in a variety of materials.

Spur Gears

In diametrical, circular or module pitches with tooling available most pitch sizes in both 14½° and 20° pressure angle for gears up to 730mm diameter.

Helical Gears

With helix angles up to 45° and pitch diameter up to 710mm.

Straight Racks

Racks of Module or Diametrical (DP) pitches can be supplied up to 3 Metre length and pitch up to 8 Mod or 5 D.P.

Internal Gears and Splines

Hubs up to 635mm can be machined to a depth of 100mm either standard spur gear or internal splines.

Splines and Serrations

Involute, flat root, or fillet root splines and serrations can be cut on machined shafts or customer blanks.

Special Gearboxes

Custom designed gear systems can be supplied to suit individual drive requirements, using spur gears, helical gears, or inverted tooth chain. Shaft centres to 1½ metres and power ratings to 1000KW have been provided. We welcome the opportunity to quote for your requirements.

Bevel and Mitre Gears

Bevel and Mitre Gears are used to transmit power between shafts intersecting at 90°, on low speed, high torque applications where pitch line velocity does not exceed 5 m/s. All Cross+Morse gears are cut to the Gleason System to provide equal strength between pinion and gear.

Interchangeability

Bevel gears of identical pitch and teeth but from different drive ratio gearsets are not interchangeable. All bevel gears are generated on the pitch cone radius which varies with the ratio of gears within a given diametral pitch.

Installation

All mitre and bevel gears develop end thrust which must be counteracted by bearings of adequate capacity. Accurate and rigid mounting of both gear and pinion provide quiet operation and long life. Bearing spacing and shaft stiffness should be selected to keep shaft deflection below .025mm.

Lubrication

Grease lubrication can be adequate for low speed applications but oil splash lubrication is always preferable. The oil level should cover the face of the lower gear, and sufficient capacity should be available to keep oil temperature below 95°C.

Efficiency

When correctly aligned, a bevel gearset with oil lubrication can operate with transmission efficiency up to 98 per cent.

Selections in tinted area have pitch line velocity over 5 m/s. For these selections it is recommended teeth are induction hardened.

Design and Selection

The power steel bevel gears can transmit under ideal lubrication conditions is normally limited by wear life. The following tables give design power in kW for a normal operating life of 10,000 hours for stock gears. For increased life gears can be induction hardened.

For correct selection of a Bevel Gearset first assemble application data, including Power, shaft speeds and drive ratio required.

- From details of Driver and Driven equipment select correct Service Factor from table below.
- Calculate Design Power kW
Design Power = Actual Power × Service factor.
- If Drive ratio not available determine from
Ratio = $\frac{\text{R.P.M. High Speed Shaft}}{\text{R.P.M. Low Speed Shaft}}$
- From table for Drive Ratio (i.e. 1:1 Mitre Gear, 1.5:1 to 4:1 Bevel Gears), select smallest gearset where Power equals or exceeds Design power at Pinion R.P.M. For variable speed drives check selection at max. shaft speed, torque and power.

Service Factors

Power Source	Character of Load of Driven Equipment		
	Uniform	Moderate Shock	Heavy Shock
Uniform	1.00	1.25	1.75
Light Impulse	1.25	1.50	2.00
Heavy Impulse	1.50	1.75	2.25

For speed increase drives add 0.1 to above factors.

Standard Metric Mitre Gears

Gear Type 'A' *

Gear Type 'B'

Cross+Morse standard stock metric mitre gears complement the existing range of diametral pitch gears to provide the designer a wider range of selection. The mitre gear sets are available in 7 tooth sizes in 9 pitches from 1.0 Mod to 5.0 Mod, providing the correct solution for right angle drives in applications from light instrumentation and office equipment to heavy manufacturing machinery. All gears are manufactured in medium carbon steels for high strength and durability, and can be optionally induction/flame hardened for more arduous applications. The gears are cut to the Gleason System with 20 degree pressure angle, and supplied only in pairs to ensure correct matching.

For long life and efficient operation it is essential that mitre gears are correctly mounted on rigidly supported shafts with bearings able to support the axial and radial loads imposed. The shafts should be at a true right angle within the following tolerances:-

Shaft Axis to intersect within $\pm 0.025\text{mm}$. Shafts to be at right angles within $\pm 5'$ angle. The mounting distance (Dimension 'A') to be true within $+0.0/-0.05\text{mm}$

All gears stocked with standard plain bore. Rebore, keyway, setscrew and induction hardening services available.

Bevel and mitre gears with other D.P. and module can be supplied to order up to 375mm diameter. All dimensions in mm.

*Type A where 'G' less than 'E'

Standard Metric Series Bevel Gears

Cross+Morse standard stock bevel gears complement the existing range of diametral pitch gears to provide the designer a wider range of selection. Available in 4 standard ratios with 9 different pitches ranging from 1.0 Mod to 5.0 Mod, these bevels provide the ideal solution for many right angle drive applications from light instrumentation to rugged manufacturing plant and agricultural equipment.

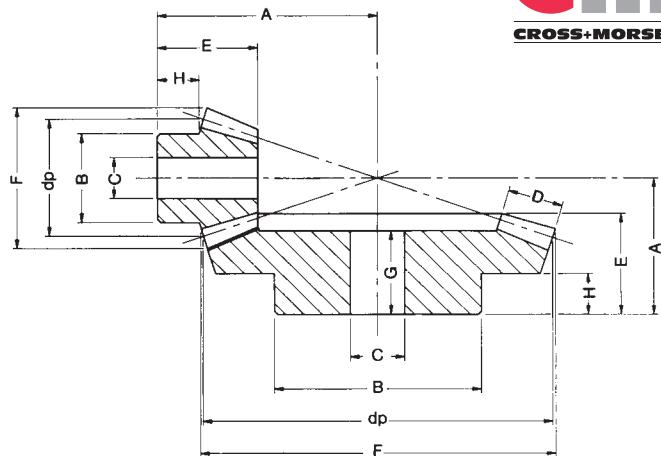

All gears are manufactured in medium carbon steels for high strength and durability, and can be optionally induction/flame hardened for more arduous applications. The gears are all gear cut to the Gleason System with 20 degree pressure angle, and supplied only in complete sets to ensure correct matching.

For long life and efficient operation it is essential that bevel gears are correctly mounted on rigidly supported shafts with bearings able to support the axial and radial loads imposed. The shafts should be at a true right angle within the following tolerances:-

Shaft Axis to intersect within $\pm 0.025\text{mm}$

Shafts to be at right angles within $\pm 5'$ angle

The mounting distance (Dimension 'A') to be true within $+0.0/-0.05\text{mm}$

All dimensions in mm.

All gears stocked with standard plain bore. Rebore, keyway, setscrew and induction hardening services available.

Bevel and mitre gears with other D.P. and module can be supplied to order up to 375mm diameter.

Spur Gear Selection

For a required centre distance and gear ratio a suitable pair of spur gears can be selected used and assessed by the following procedure.

Select numbers of teeth in gears and module (pitch).

$$\text{Gear Ratio } i = \frac{Z_2 \text{ (Teeth driven gear)}}{Z_1 \text{ (Teeth driven gear)}}$$

Shaft centre distance in mm = $\frac{1}{2}$ sum gear teeth \times pitch

$$= \frac{1}{2} (Z_1 + Z_2) P$$

From this initial selection each gear can be assessed for strength and wear using the following formulae. The least of the four calculated powers is the capacity of the gear set. The capacity required is determined by multiplying actual power by a service factor relative to driver and driven equipment, refer page 3. If calculated power is below required capacity increase pitch or face width of gears, adjust teeth sizes accordingly, and reassess drive. If calculated power is substantially in excess of required capacity a lower Module could be considered.

Standard Spur Gears

Dimensions tables for Spur Gears 2.0 to 6.0 Mod.

All gears machined from medium carbon steels.

Gear Widths mm

Pitch	A	B
2 Mod	35	20
2.5 Mod	40	25
3 Mod	50	30
4 Mod	60	40
5 Mod	75	50
6 Mod	80	60

Gear Type 'A'

Gear Type 'B'

2.0 Mod Spur Gears

Steel Racks

Racks can be supplied modified to enable easy mounting by addition of plain or tapped holes.

Steel Racks

Cross+Morse standard gear racks are manufactured in medium carbon steel suitable for induction or flame hardening if required. The spur racks are precision machined with 20 degree pressure angle, and to be completely compatible with standard range of spur gears have identical face width. The designer is free to select any combination of standard spur gear and rack of same pitch to obtain "off the shelf" rack and pinion sets. These provide the ideal method to convert rotary into linear motion for table drives etc. or linear to rotary motion as in feeds. In addition to the standard range of racks special constructions can be provided with pitch size up to 16 mod.

Formulae and Conversion Factors

Useful formulae in Power Transmission Calculations

1. Motor Power (kw) $P = \frac{T \times n}{9550}$
2. Torque (Nm) $T = \frac{9550P}{n}$
3. For Solid Cylinder Inertia (kg m^2) $I = \frac{md^2}{800} \times 10^{-4} = \frac{\pi lqd^4}{32000} \times 10^{-6}$
4. For Hollow Cylinder Inertia (kg m^2) $I = \frac{m(da^2 - di^2)}{800} \times 10^{-4} = \frac{\pi lq(da^4 - di^4)}{32000} \times 10^{-6}$
5. Flywheel Inertia $GD^2 (\text{kp m}^2) \triangleq 4 \times I$
6. Acceleration Torque (Nm) $T_a = \frac{0.105 It(n_2 - n_1)}{ta}$
7. Total drive Torque (Nm) $T_t = T_a + T_L$
also $T_t = \frac{K Ts + T_L}{1 + K}$ where $K = \frac{I_L + I_t}{I_d}$
8. Tooth & Belt/Chain drive speed m/Sec $V = \frac{Z \times p \times n}{60,000}$
9. Pull in Belt/chain (N) $F_L = \frac{P \times 1000}{V}$
10. Centrifugal Pull Belt/Chain $F_C = WV^2$

Where

d	=	diameter - mm	p	=	chain/belt pitch - mm
da	=	outside diameter - mm	P	=	Power - kw
di	=	inside diameter - mm	q	=	density - kg/cm^3
F _c	=	Centrifugal - Newtons	ta	=	time acceleration - secs
F _L	=	Load (Power) Pull - Newtons	T	=	Torque - Nm
I	=	Inertia - kgm^2	T _a	=	Acceleration Torque - Nm
I _d	=	Inertia of Driver - kgm^2	T _L	=	Load Torque - Nm
I _L	=	Inertia of Load - kgm^2	T _s	=	Motor Starting Torque - Nm
I _t	=	Total Inertia - kgm^2	T _t	=	Total Torque - Nm
l	=	length - mm	V	=	Velocity - m/Sec
m	=	mass - kg	W	=	Weight - kg/m
n	=	rotational speed - r.p.m.	Z	=	No. Teeth
$n_2 - n_1$	=	change in speed - r.p.m.
